

UCC Marketing OS

A guide to understanding and testing the app

This pack explains, in plain language, what the marketing operations app for United Ceres College does, how to get it running, and exactly what to try. No coding knowledge is needed.

An honest note before you start. This is a working prototype, not a finished product. Some parts need a connection key or a live test with real accounts before they are fully proven. Section 5 lists what is not finished, so nothing here overstates how ready it is.

Prepared 5 July 2026. Runs on your own computer for now (it is not yet on a public web address).

SECTION 1

What this system is

UCC Marketing OS is a marketing operations app for United Ceres College. It is objective-first, which means every activity is tied to a measurable goal. It runs on one simple principle: **AI recommends, humans decide**. The AI only ever writes drafts. A person reviews and approves everything, and nothing is ever published or approved automatically.

What it does

- Plan marketing campaigns, each tied to a clear objective
- Generate content calendars and copy with AI, always as drafts you approve
- Check wording against education marketing compliance rules
- Track KPIs and real results against targets
- Produce weekly reports and a permanent approvals record for management

SECTION 2

Visual overview

The journey a user follows, from setting up to reporting. Each box is a stage. The green **APPROVE** markers are the points where a person must approve before the work moves on.

The menu, grouped into five sections

The left-hand menu is grouped so related screens sit together. On a fresh, empty workspace only "Set up" is opened, so a beginner is not faced with everything at once.

Dashboard the home overview you return to

Measure

KPI TrackerReportsComplianceBudget & Resources

Every screen is still there; the groups just tidy the menu. Each section can be opened or closed.

SECTION 3

How to get it running

You do not need to write any code. These are the only steps:

- Make sure the computer has **Node.js version 20 or newer** installed (a free tool for running the app).
- Get the code: the repository is **f3nd1/social_media_os**. Use the **main** branch.
- Open a terminal (a text command window) in the project folder.
- Type **npm install** and press enter. This sets things up once. Wait for it to finish.
- Type **npm run dev** and press enter. This starts the app.
- Open a web browser and go to **http://localhost:3000**
- To stop the app, return to the terminal and press **Ctrl and C** together.

The three connections, and whether you need them

The app works on its own. These connections add extra power, and each one is optional.

Connection	What it is for	Optional?	Without it
Supabase cloud save	Saves your work to the cloud so it is safe and follows you between devices.	Optional	Everything still works and stays saved on this one browser.
OpenAI AI features	Lets the app draft strategy, calendars, and copy for you.	Optional	The AI buttons fall back to simpler offline templates, clearly labelled "Offline draft, AI not connected".
Metricool or CSV analytics	Brings in your real social media numbers.	Optional	You can type numbers in by hand, or import a CSV file.

The easy way to connect everything: open **Settings** and click "**Run setup guide**". It takes over the whole screen and walks you through each connection, one step at a time. It **tests each connection as it goes**, so a step only turns green when the connection genuinely responds. Every step can be skipped, and you can leave and come back to it any time.

What to test

A. One end-to-end path (tick as you go)

- ☐ Open **Settings** and click **Run setup guide**
- ☐ Choose **Set up my own**
- ☐ Connect Supabase, OpenAI and Metricool, or skip each (all optional)
- ☐ Read the short compliance reminder and continue
- ☐ Enter a **brand name** and tone of voice
- ☐ Add at least one **course**
- ☐ Add at least one **audience**
- ☐ Record a **quick audit** for one platform
- ☐ Generate or type a **Strategy Brief**, then **approve** it
- ☐ Finish the guide and click **Generate my first content calendar**
- ☐ Open the calendar, open an item, and **approve** it
- ☐ Open the **Dashboard** and check the setup status and numbers have updated

B. What each screen does, and what "working" looks like

Screen	What it does	Working looks like
Brand	Your name, voice, colours, goals	You can type and it saves
Courses & Audiences	What you offer and who to	You can add and edit both
Settings	Connections, and sample vs your own data	Test buttons report a real result
Objectives & Audit	Your goal plus a baseline per platform	You can add an audit and see a score
Competitors	Track other colleges Needs OpenAI for insights	You can add competitors; AI insights need a key
Platform Strategy	Which platform per audience, trends, listening	Guidance shows; trends and listening need keys or a worker
Strategy Brief	Turns everything into a plan Needs OpenAI for the AI draft	You can approve it; the badge turns to approved. You can also write it by hand
Campaigns	Group work into campaigns and approve them Needs OpenAI for ideas	An approved campaign shows as approved
Content Calendar	Your month of posts Needs OpenAI for AI generation	Items appear after you generate from the approved brief; an offline template also works
Production Board	Write, check and approve each post Needs OpenAI for copy	You can move an item along to "manager approved"
Asset Library	Store photos, videos and files	You can add and see assets

KPI Tracker	Real results against target	You can enter results and see status
Reports	Weekly summary, approvals log, PDF and CSV export	Export downloads a dated file
Compliance	Checks wording against the rules Needs OpenAI for deeper review	Paste risky wording and see it flagged (the rule check works without a key)
Budget & Resources	Plan campaign costs	You can add and total a budget
Dashboard	Overview, setup status, approvals pending, Singapore prompts	It reflects what you have entered

About the AI features. Anything marked **Needs OpenAI** only fully works once an OpenAI key is added (in Settings, or during the setup guide). Without a key these show simpler offline drafts labelled "Offline draft, AI not connected". That is expected, not a fault. The rule-based compliance check, approving a brief, and an offline calendar all work without a key.

SECTION 5

Known limitations and open items

Being straight about what is not finished:

- **Metricool gives brand-level totals, not per-network numbers.** For per-platform detail, use the CSV import instead.
- **Platform connections other than Metricool store your keys but do not sync data yet.** Use CSV or type numbers in for those.
- **Social listening needs a hosted background worker when the app is deployed.** It may not run on a simple serverless host without one. The PDF text extraction and one compliance extraction route use similar small helpers.
- **The app is not yet on a public web address.** It runs on your own computer for now.
- **There is no login and no user roles yet.** Anyone with the link, and the Supabase key if that is connected, can read and write the data. Fine for a prototype, but not for real student data.
- **The live AI, Supabase and Metricool paths were checked by simulation during development.** They still need a final test with real keys on a real machine.
- **The approver name is free text for now,** so the audit trail records a typed name rather than a verified login.

SECTION 6

How to give feedback

If anything looks wrong, confusing, or missing, please note these four things. They make it quick to fix:

- **Which screen** you were on
- **What you expected** to happen
- **What actually happened**
- **A screenshot** if you can

One extra line that helps a lot: **was AI connected** (an OpenAI key added) at the time? Some buttons behave differently with and without a key, so knowing this saves a lot of guessing.

Thank you for testing. Your notes go straight into making it clearer and more reliable.
